Pilot Check-In – Meeting Notes (10/22/2026)

Canva presentation slides

Attendees

- Ernest Bagambiki, Rwanda Meteorology Agency
- Steven Higiro, Rwanda Meteorology Agency
- Godfrey Musafiri, Rwanda Meteorology Agency
- Elsabet Temesgen, Ethiopian Meteorological Institute

HydroServer Workshop

- Rwanda Meteorology Agency is organizing a HydroServer training in January
- CGS will support, as possible (e.g., join sessions that start at 5 AM PT / 2 PM RT)

Ethiopia

- **Elsabet**: They have been busy moving to the new office and hosting visitors. Consequently, she doesn't bring any updates but will discuss it with colleagues. They are moving forward with wis2box; need to touch base with their IT department about data and integration. Caroline suggests aligning with SOFF. Sara suggests contacting Peter Mutai.
- **Elsabet**: Confirms biweekly regular office hours.

Rwanda

- **Ernest**: They have one station publishing to WIS2. They are planning to add five more stations to report to WIS2; installation will start in 2027 and will take one month. They need technical support with WIS2 and AWS integration once installation is complete.
- **Steven**: They have migrated from GTS to WIS2, and all new stations will be using WIS2. Therefore, he doesn't think they should focus on Sebeya catchment, but the whole country. Additionally, they need additional WIS2 in-house training in early 2027. Sara mentions that we are developing asynchronous training materials so there's a legacy of information for current and future employees.

- **Godfrey**: They would like the HydroServer pilot to focus on the Sebeya and Upper Akagera catchments. They have not yet deployed HydroServer; they need the IT department to align and train, which is the motivation behind the HydroServer training next year. Additionally, they need budget adjustments.
- **Godfrey**: They could use both technical assistance (e.g., in-house training) as well as hands-on collaboration through examples. Sara suggests reaching out if they need help, even if it's just to walk through a single station as an example.
- **Ernest**: They would like to ask for technical assistance asynchronously over email. Ben shares his email as a direct contact for WIS2 support.
- **Steven**: Confirms that regular office hours and on-demand sessions are helpful.
- **Godfrey**: Due to other engagements and assignments, biweekly office hours may not work. They may need an on-demand session in November. Sara clarifies that office hours are optional.

Pilot check in – Meeting Notes (10/15/2026)

1. Uganda

- The team is working on setting up a local HydroServer instance hosted in the cloud and creating the necessary user accounts.
- They have experienced some login issues that need to be resolved.
- One of the priorities is to institutionalize the HydroServer installation to ensure its long-term use and maintenance.
- The team plans to integrate HydroServer with one of their monitoring stations that has recently resumed operations.
- The station is now operational, and the next step is to assess whether its data can be integrated into HydroServer.
- The team noted that HydroServer is user-friendly.

3. Reubens – Nyando Pilot (Kenya)

- The team is focusing on the Nyando pilot area.
- Three telemetry stations have been identified. They are operational but are not yet transmitting data.
- The team plans to replace the communication cards to restore data transmission.

- A mobile application has been developed to collect data manually from monitoring stations.
- Reubens is also checking the status of the stations in the field.

4. Peter – WIS2Box (Kenya)

- WIS2Box is currently running with data from two monitoring stations.
- The team has agreed to use Amazon Web Services (AWS) to support the deployment.
- Once the stations begin streaming data, the intention is to transmit the observations to the WIS2Box node.

5. Godfrey – WIS2Box Implementation (Uganda)

- The team is working on registering additional monitoring stations.
- The objective is to begin exchanging observational data through WIS2.
- Progress has been limited, and additional technical work is still required.
- Godfrey's team is coordinating with Peter to address the remaining challenges.
- They have also encountered issues with the configuration of the virtual machine hosting the system.

6. Caroline – Deployment and Data Integration (Uganda)

- Caroline's team has started the deployment process and identified areas where additional technical support is needed.
- Integration with AQUARIUS is one of the main priorities.
- The team also discussed the integration of monthly data and other existing software systems.
- REMID was mentioned as a potential system or resource for integration (name to be confirmed).
- Two satellite data sources were discussed, including EUMETSAT.
- The team should explore the availability and potential use of EUMETSAT satellite data.

Potential Follow-Up Actions

1. **Uganda:** Resolve HydroServer login issues, establish a sustainable institutional deployment, and test integration with the recently restored monitoring station.
2. **Reubens:** Replace the communication cards at the three Nyando telemetry stations, verify data transmission, and continue testing the mobile application for manual data collection.
3. **Peter:** Confirm the Amazon Web Services deployment configuration and test the transmission of streaming observations to WIS2Box.
4. **Godfrey:** Continue station registration, resolve virtual machine configuration issues, and coordinate with Peter on WIS2 data exchange.
5. **Caroline:** Continue deployment, identify integration requirements for AQUARIUS and other systems, and investigate EUMETSAT data availability.
