

Session 10 – Interactive Exercise

Refining Your Pilot for MHEWS Under El Niño

Ms. Emily DuBois & Dr. Caroline Staub

CGSearch.org

This workshop is supported by funding from the United States government.

Agenda

Session 10: Refining Your Pilot Proposal

- Emily introduces the interactive exercise
- Groups refine pilot through the interactive exercise
- Groups complete pilot revision worksheet

Break

Session 11: Pilot Implementation Roadmaps

- Each group will briefly present their refined and revised pilot proposal
- Q&A and feedback
- Guest Speaker

Current Hydrometeorological System

Key Takeaways

Many challenges clustered around data collection, transmission, and sharing

Problems at one point affect the entire data chain

Importance of maintenance, staff capacity, interoperability, and stronger coordination between institutions

Our Objective

Refine your pilot concept and consider whether it can deliver the information a priority user needs, particularly during a high-impact rainfall event in an El Niño year.

Scenario-Based Design

Frontend development builds the parts of an application that users see and interact with.

We use **scenario-based design** to design around specific, real-world situations:

Scenario = User + Task + Context

Each scenario helps us trace the **flow of information from data and APIs to the user**.

Keep It Simple

Focus on one slice of your system.

You don't need to cover every dataset, user, task, and context. Choose parameters that challenge your pilot.

Use the framework flexibly.

This is your time to refine your pilot with what you've learned this week.

Current Hydrometeorological System

Refine your pilot from the consultation worksheet for **one priority dataset**.

📌 **Section 4.4**

Follow the data to **one priority user**.

📌 **Section 4.5**

Stress test your pilot with a **high-impact rainfall event** in an El Niño year.

📌 **Section 4.6**

Step 1: Refine Your Pilot for One Priority Dataset

In your groups, consider the following questions:

- What are we testing?
- What data will we use?
- How will the data move?

Draw your pilot system diagram from the perspective of how your one priority dataset would flow through the system.

Step 1: Refine Your Pilot for One Priority Dataset

Step 2: Follow the Data to One Priority User

Choose **one priority user** from your pilot proposal worksheet or choose someone new!

Think through the **responsibilities and needs** of your priority user.

Consider the following questions:

1. What decisions are they trying to make?
2. What information do they need?
3. How quickly / how far in advance do they need it?

Step 2: Follow the Data to One Priority User

Our Context

Heavy rainfall is occurring or expected, river levels are rising, and demand for timely information increases. Some data transmission may also be delayed or interrupted.

Step 3: Stress Test During High-Impact Rainfall

Look at the system from the **perspective of your priority dataset(s) and priority user.**

Consider the following questions:

1. Can our priority user get the information they need in time to act?
2. Where is the weakest point in our proposed workflow?
3. What is the one thing we should test or change in the pilot because of this?

Step 3: Stress Test During High-Impact Rainfall

Revise Your Pilot

For the remainder of the session, you'll focus on what it would actually take to implement your pilot.

In your groups, **complete the Pilot Revision Worksheet** using your learnings from the technical trainings and the refinement exercise today.

In the **next session**, you will **present your roadmap** and gather feedback through a group Q&A.

Thank you!

Please leave your diagrams, worksheets, and other notes at your tables so that we can photograph them for the workshop documentation.

We can return them to you before the workshop concludes if you'd like to keep them.
