

REPORT BACK

METEO RWANDA

Our Revised Pilot (WIS2 Context)

- METEO RWANDA to transitioning important national data to WIS2 Global Discovery and Access
- Priority Datasets: Hourly synoptic observations (Surface) and daily climate summaries in Sebeya Catchment
- WIS2 Data Workflow: Ingestion AWS, manual data ingested via Climsoft
- Processing: Data converted to a normal format
- Publication: Published via WIS2 Global Broker using MQTT
- Discovery: Metadata records updated in the Global Discovery Catalogue

What Changed This Week

- METEO RWANDA switched our data format from CSV to BUFR to comply with WIS2 core standards to have the pilot of Sebaya at Western part of the where we normally experience meteorological disaster.
- The training on the *WIS2 in a box* tool clarified that our previous format would not be discoverable by the Global Discovery Catalogue
- Impact on Pilot: In this week is to know how we can align workflow in data sharing using WIS2
- Positive: Ensures interoperability with other NMHSs
- Challenge: Additional staff are required on training on encoding

Actions & Requirements

- Technical Infrastructure: Upgrade server capacity to handle increased data traffic
- Requirement: Procurement of additional RAM/Storage
- Data Quality & Metadata: Finalize metadata generation for all priority datasets
- Requirement: Validation against WMO standard
- Operational Integration: Run a 2-week parallel test of the WIS2 publishing workflow
- Requirement: Dedicated testing window with IT support

Support & Stakeholders

- Who needs to be involved:
 - Internally IT Database Admin, Head of Observations, Data Quality Officer
 - External: WMO Secretariat, Regional WIS2 Focal Point, Vendor Support
 - What support is required:
 - Technical Assistance (TA), Expert review of our MQTT broker configuration
 - Training: Advanced training on WMO Core Metadata Profile version 2 (WCMP2) metadata
- Resources:
- Capacity building for the Met staff on WIS2.0
 - Schedule a technical deep-dive with the WIS2 expert team
